RQplus outsourcing

RQplus outsourcing is a new innovative way of building a Requirements Management Capability in organisations that enables your organisation to focus on your core competences. Instead of having to develop processes, methods, and information models themselves, you can now make use of best practice gathered from other leading organisations in different sectors. You can also take advantage of the advanced requirements analysis, modelling, traceability and specification support dedicated Requirements Management tools can provide, without having to do heavy investments in and learning how to use them.

Your challenge

You realise that Requirements Management is a key Capability required to be successful in acquiring or developing complex systems.

You want to draw from the experiences others have made rather than inventing the wheel yourself.

You want a cost-effective solution to developing the Requirements Management function.

You would like to benefit from the advanced featu-res of a high-end Requirements Management tool but avoid the overhead costs that comes with such tools.

Deliverables

Based on a Service Level Agreement, Syntell deli-vers the agreed Requirements Management support to the organisation. Initially, Syntell works together with the client to define the processes and methods to be used. The interfaces to other processes are

defined and also the basic information model, thus setting up the structure for handling information security issues.

Once the basic set-up is done Syntell supports the individual projects in adapting the capability to the projects' needs. This includes setting up the informa-tion model for the project, defining the requirement attributes, adapting the project organisation to the conditions of the project.

Syntell also manages the Requirements Manage-ment tool (IBM DOORS), while the engineers will work in the familiar Microsoft Office environment. Syntell maintains the database, guarantees the integrity of the information (including back-up of the database), and serves the users with a structured import/export of requirements to/from the RM tool.

Why Syntell?

Syntell is a Sweden based consulting and educa-tion company focusing on lifecycle management of complex systems. Core competences are Systems Engineering, Support System Engineering, Require-ments Management and Configuration Management. Syntell has extensive experience in supporting and training supplier as well as procurement organisa-tions.
